SUMMARY

Computer Science student and aspiring Full-Stack Developer with strong focus modern frontend technologies like React and TypeScript and on backend development using NODE.JS, FastAPI, Django. Experienced in building real-world systems including a learning platform with payment integration and QR-based attendance tracking. Passionate about scalable systems, clean architecture, and integrating AI-driven feature

EDUCATION

BSc in Computer Science (3rd year Student)
University of Gondar

2024 – 2027

SKILLS

- Languages: JavaScript, Python, TypeScript, Java,
- Frontend: React, Tailwind CSS, HTML
- Backend: NODE.JS, FastAPI, Django, Authentication Systems
- Database: MongoDB, PostgreSQL
- Tools & Others: Git & GitHub, Postman

PROJECTS

Project 1: SpentWise – Full-Stack AI Personal Finance Platform

Description:

- Developed a scalable personal finance web application using **Django** and **Tailwind CSS**, featuring dynamic budget capping, category management, and automated transaction tracking.
- Built and integrated an NLP classification pipeline using **Scikit-Learn (TfidfVectorizer + LogisticRegression)** to automatically categorize raw expense descriptions with real-time confidence scoring.
- Engineered a hybrid anomaly detection engine pairing an **Isolation Forest ensemble model** with statistical **z-score analysis** to identify multi-dimensional irregular spending patterns.
- Optimized system performance and minimized disk I/O latency by implementing the **Singleton Design Pattern** to cache heavily utilized machine learning models directly in-memory.
- Decoupled backend ML computations from the frontend UI by architecting a lightweight, asynchronous **RESTful API pipeline** using JavaScript Fetch and safe CSRF token validation mechanisms.

Project 2: Learning Platform (Backend-focused)

Learning Management System (LMS)

Description:

- Designed and developed a full-stack learning platform supporting course management and user authentication.
- Integrated payment system using Chapa API.
- Implemented QR-based attendance system for students.
- **Automated Inquiry Resolution System:** Architected a secure communication pipeline using **Nodemailer** and SMTP connection pooling to deliver real-time, HTML-formatted email resolutions to users upon administrative ticket updates.
- Planning to integrate AI chatbot for student support and automation.

Tech Stack: Express.js, MongoDB, JavaScript, Chapa API, React, Tailwind CSS

Project 3: Volunteer Management System

Title: Full-Stack Volunteer Management System

Description:

- Developed a system to manage volunteers, events, and participation.
- Implemented CRUD operations, authentication, and role-based access.
- Built both frontend and backend components.

Tech Stack: React, JavaScript, Tailwind CSS, Express.js, MongoDB

Project 4: Job Portal Backend (FastAPI)

Description:

- Designed and developed a RESTful backend API for a job portal using **FastAPI**
- Implemented user authentication and authorization (JWT-based login and signup)
- Built CRUD operations for job postings, applications, and user profiles
- Designed relational database models and integrated with **PostgreSQL**
- Ensured high performance with asynchronous endpoints and efficient query handling
- Tested APIs using **Swagger UI**

FUTURE FOCUS

Currently focusing on backend development with Django and exploring AI integration in web applications.
